Thinking in React

@abhirathmahipal

What's Covered?

1. Code a simple stopwatch using Vanilla JavaScript.
2. The same stopwatch using React.
    a. Understand the overall workflow of developing a React app.
    b. Pick up some React concepts along the way.
3. Contrast between both the approaches and try understanding where React shines and suffers.

Disadvantages

1. Boilerplate code is a little too much.
2. Tends to perform poorly when there are a lot of nodes.

End
